National Exams December 2014

98-Pet-A4, Oil and Gas Well Drilling Completion

3 hours duration

NOTES:

1. If doubt exists as to the interpretation of any question, the candidate is urged to submit with the answer paper, a clear statement of any assumptions made.

2. This is an OPEN BOOK EXAM. Any non-communicating calculator is permitted.

3. FOUR (4) questions constitute a complete exam paper. The first four questions as they appear in the answer book will be marked.

4. Each question is of equal value.
1. 

a-) By using the data given below, decide how many drilling lines you must have. Ignore buoyancy effect.

<table>
<thead>
<tr>
<th>TVD ft</th>
<th>( L_{DC} ) ft</th>
<th>( L_{DP} ) ft</th>
<th>Holisting Speed ( \text{ft/min} )</th>
<th>( W_{DC} ) lb/ft</th>
<th>( W_{DP} ) lb/ft</th>
<th>Input Power to Fast Line, HP</th>

**TVD** : True vertical depth, ft  
**L_{DC}** : Length of drill collars, ft  
**L_{DP}** : Length of drill pipe, ft  
**w_{DC}** : Unit weight of drill collar in the air, lbm/ft  
**w_{DP}** : Unit weight of drill pipe in the air, lbm/ft
2-) Given the following data:

Drilling Fluid Density: 12 ppg  
Well Depth: 10,000 ft.  
Drill Bit Nozzle Sizes: 13-13-13  
Pump Horsepower: 1800  
Pump Volumetric Efficiency: 80%  
Maximum Pump Pressure: 4,500 psi  
Minimum Flow Rate: 350 gpm  
Parasitic pressure losses of 2,173 psi and 1,388 psi are anticipated while circulating mud at flow rates 500 gpm and 390 gpm respectively.

a-) Determine the parasitic pressure losses when the bit hydraulic horsepower is maximum.

b-) Determine the optimum flow rate when the bit hydraulic horsepower is maximum.

c-) Determine the pressure drop across bit nozzles when the bit hydraulic horsepower is maximum.

d-) Determine the optimum sizes of three nozzles to be used for the next bit run using the maximum bit hydraulic horsepower criteria.
3-)

Your company wants to complete a well at 15,000 ft. using a 6 5/8 in. production casing. Relevant drill hole data are given below:

Open Hole Diameter : 8 1/2 in.
Mud Weight @ 15,000 ft. : 16 ppg
Formation Pore Pressure Gradient @ 15,000 ft. : 15.5 ppg
Formation Fracture Pressure Gradient@ 15,000 ft. : 17.6 ppg
Formation Temperature @ 15,000 ft : 180 °F
Normal Formation Pressure Gradient: 0.465 psi/ft.

a-) Please prepare a casing program for this well. Your design should provide Grade, Weight, and length of the each casing section selected. Consider anticipated collapse burst and tensile load for your design. Assume that the gas is going to be produced.

4-

**Drill Hole Data:**
Depth: 12,200 ft

Casing: 10 3/4 in. x 10 in. set at 4000 ft.

Mud Weight: 12 ppg.

Open Hole Diameter: 8 1/2 in.

Mud Circulation Rate: 400 gal/min

Parasitic Pressure Losses at 400 gpm: 3000 psi.

Reduced Speed Pump Circulating Rate: 200 gpm.

Parasitic Pressure Losses at 200 gpm: 750 psi.

Total Volume of Mud in Tanks: 1000 bbl.

Surface Temperature: 60 °F

Temperature @ casing shoe: 120 °F

Temperature @ 12,200 ft: 160 °F

**Drill String Data:**

Length of Drill Pipe: 11,600 ft.

Length of Drill Collars: 600 ft.

Capacity of Drillpipe: 0.014 bbl/ft

Capacity of Drill Collar: 0.0087 bbl/ft

Capacity of Drill collar-Openhole annulus: 0.035 bbl/ft

Capacity of Drillpipe-Openhole annulus: 0.0775 bbl/ft

Capacity of Drillpipe casing annulus: 0.1215 bbl/ft
Initial Kick Data:

Pit Gain : 15 Bbl.  Methane Kick (assume kick moves as a slug)

Shut-in Casing Pressure : 400 psi.
Shut-in Drill Pipe Pressure : 200 psi

Safety Margin : 0.2 ppg for kill mud weight

100 psi for initial circulating pressure

It was decided to circulate the kick out of the well using Driller's method. When the top of the kick zone reaches to the casing shoe, determine the following parameters:

a-) Length of kick zone, ft.
b-) Equivalent mud density at the casing shoe, ppg.
c-) Casing pressure at the surface
d-) Mud volume pumped, bbl
e-) Determine the drill pipe pressure schedule (drill pipe pressure vs. time) as the kill mud is being pumped down the well.
5-) 

The average bit life of the bits in use is 30 hrs. After 15 hrs of drilling, the bit was pulled out at 12,000 ft. depth and well logging was run.

Then, the drilling is to be resumed and your decision is needed whether to run this half used bit or a new one.

Make your decision based on the minimum cost criteria and the fact that used bit costs you nothing.

The other relevant data are given as follows:

Rig operational cost: $1500/hr
Bit Cost: $10000
Trip Time: 0.0012*Dout
Connection Time: 2 min/single
Length of 1 single: 30 ft

Based on the field data, the following relationship is known for drilling time vs. distance drilled.

\[
D_{out} = \frac{\ln\left(0.025t_d + e^{0.00008D_{in}}\right)}{0.00008}
\]

Where:

\(D_{in}\) = Depth at the start of the drill bit run, ft
\(D_{out}\) = Depth at the end of the drill bit run, ft
\(t_d\) = Drilling time, hrs.
