NOTES:
1. If doubt exists as to the interpretation of any question, the candidate is urged to submit
   with the answer paper a clear statement of any assumption made.

2. Each candidate may use an approved model of Sharp or Casio calculator; otherwise, this
   is a CLOSED BOOK Examination.

3. Six questions constitute a complete paper. Answer ALL questions #1 through #5.
   Answer ONLY ONE of #6, #7 or #8.

4. The marks assigned to each question are shown in the left margin.
1. For each of the structures shown state whether it is unstable, statically determinate, or statically indeterminate. If the structure is statically indeterminate, state the degree of indeterminacy. Structures a) through d) have beam-type members.

Structures e) through f) have truss-type members. Diagonals are not connected where they cross.
2. For each structure shown, compute the reactions and draw shear and bending moment diagrams. Indicate which are positive and which are negative segments of each bending moment diagram. For each shear and bending moment diagram, calculate and indicate the magnitudes of the maximum positive and negative ordinates.

(a) 

(b) 

(c) 

3. Calculate the vertical deflection at joint L₃ of the pin-jointed truss shown below. For all members EA = 69,800 kN. Take advantage of symmetry.
4. For the trusses shown below, calculate the forces in the members that are listed. For each force, indicate whether it is tension or compression.

a) Calculate the forces in:
   \( U_1 - U_2 \)
   \( U_1 - L_3 \) and
   \( L_3 - U_3 \)

b) Calculate the forces in:
   \( L_2 - L_3 \)
   \( L_3 - L_4 \) and
   \( M_1 - L_3 \)
5. a) For the determinate structure shown, draw the influence lines for:

i) bending moment at point \( \text{2} \)  
ii) bending moment at mid span of span \( \text{1} \) - \( \text{2} \)  
iii) shear immediately left of support \( \text{2} \)

For each influence line, calculate and indicate the value of the influence coefficient that has the maximum absolute value.

![Structure Diagram]

b) A vehicle, which is idealized as the three point loads spaced as shown below, moves on beams at the bottom chord level of the truss shown. The shape of the influence line for force in member \( \text{U}_1 \) - \( \text{L}_3 \) is shown below the truss. Calculate and show the ordinates of the influence line and calculate the maximum force caused by the vehicle as it crosses the structure.

![Vehicle Diagram]
Select and answer ONE QUESTION ONLY from Questions #6, #7 or #8.

(22)  6.  For the frame shown below, using the moment-distribution method or the slope-deflection method, calculate and plot the shear force and bending moment diagrams. On both diagrams, for each member, label the magnitude of the maximum and minimum ordinates (Minimum ordinates are frequently negative values). All members have the same EI value and are inextensible.

(22)  7.  a)  Use the principle of virtual work to calculate the vertical deflection at point (4). Both beams have the same EI = 36,000 kN.m^2 and both are inextensible. The tie rod has EA = 25,000 kN.

b)  If the 48 kN vertical load were at point (4) instead of point (2), what would be the vertical deflection at point (2)?
Select and answer ONE QUESTION ONLY from Questions #6, #7 or #8.

8. For the structure shown below, compute the reactions and draw shear and bending moment diagrams. On both diagrams, for each member, calculate and label the magnitude of the maximum and minimum ordinates (Minimum ordinates are frequently negative values).
